

Permanent magnets and magnetic materials require special precautions. Please read these instructions carefully before use. If you have any further questions, please feel free to contact us. Observe the following notes to avoid injuries and damage.

HANDLING

Extra caution around children:

Not for children under 14! Always keep magnets away from children! Swallowed magnets can cause serious internal injuries!

No machining and no collisions!

Incorrect handling of the magnets leads to a loss of magnetic force and destroys the magnet. It also produces highly flammable drilling dust and poses other significant health risks from the following hazards:

HAZARDS FROM MAGNETS

INJURIES

If handled improperly, magnets can cause crushing, bruising or other injuries.

SPLINTERS

Magnets are brittle. Collisions cause small fragments to chip off, which can lead to health hazards and damage to the magnet.

MAGNETIC FIELDS

Strong magnets can impair or destroy electronic as well as mechanical components (pacemakers, data storage media, credit cards, electronic devices, etc.).

PEOPLE WITH PACEMAKERS

People with pacemakers or implants must keep a distance of at least 15 cm.

OTHER RISKS

- Health hazard on contact with food and drinking water. Only use magnets that are specifically intended for this purpose!
- Many magnets have coatings to which some people are allergic (e.g. nickel). You should therefore avoid excessive direct skin contact with the magnets.

TRANSPORT AND SHIPPING

When shipping magnets, the applicable regulations for stray magnetic fields in air transport must be observed (IATA Dangerous Goods Regulations). These regulations also apply to built-in magnets.
